DBI was tasked with converting NASA's Headquarters Library archival space into a state-of-the-art Conference and VITS Center, redesigning the waiting room and the security desk.

This high-tech Conference Center consists of three rooms: a 99-seat Assembly Room, a 30-seat Conference Room and an A/V Control Room. The Assembly Room has a large 12 screen video wall and includes fiber optic accent lighting. The large A/V Control Room has equipment that controls all aspects of each room, and has a view into each room.

The use of Revit (Building Information Modeling) was utilized to help speed production and provide 3D renderings for NASA's full understanding of the design concept and to provide preliminary budgeting.
